Test Case Name:	Lidar Turbidity Test #0	Test ID #:	Lidar-TT-00
Description:	The Lidar System should be able to emit a signal and process the phase shift of the return signal in order to calculate water turbidity to a minimum of 80% accuracy.	Type:	

Name of Tester:		Date:	
Hardware Version:	Lidar 1.0	Time:	

Setup:	The completed Lidar design should be correctly linked to the external PC and then fully submerged in water.
--------	---

Step	Action	Expected Result	Pass	Fail	N/A	Comments
1	Write a program to collect turbidity data from the Lidar System.	The program should be statistically tested to verify accuracy and real time data. Should sample the turbidity data at a real-time rate.				
2	Submerge Lidar System in water and start data collection.	The Lidar System should stay at the bottom of the body of water. The system should remain functional and dry.				
3	Log data in external PC GUI for turbidity tracking.	Data should actively show up on the GUI interface in real time with minimal delay.				

Overall Test Result:
